

SNAP at PRISM 2026: Advancing Concussion Diagnosis for Pediatric Athletes

Oral Presentation · January 2026 · Pediatric Research in Sports Medicine Annual Meeting

CM

Dr. Christina L. Master, MD

Co-Director, Minds Matter Concussion Program · Children's Hospital of Philadelphia (CHOP)
Professor, University of Pennsylvania Perelman School of Medicine

OVERVIEW

At the 2026 Pediatric Research in Sports Medicine (PRISM) annual meeting, Dr. Christina Master delivered an oral presentation highlighting SNAP as a breakthrough tool in the rapid diagnosis and management of sport-related concussion in young athletes and conducted an interactive workshop where healthcare providers were shown how to operate SNAP in a field environment.

THE CHALLENGE

Concussion diagnosis in young athletes has long depended on subjective assessments, time-consuming evaluations, and pre-injury baseline testing — resources that are rarely available on the sideline or in fast-paced clinical settings. This leaves young athletes vulnerable to underdiagnosis, delayed care, and the risk of premature return-to-play.

WHAT IS SNAP?

SNAP is a 90-second concussion test that requires no pre-injury baseline — making it uniquely suited for real-world care. It is the fastest, most accurate concussion test available, with 90% sensitivity and 94% specificity. SNAP can be administered immediately after a head injury, on the sideline or in the clinic, and also supports clinicians during the return-to-play process.

CARE SETTINGS HIGHLIGHTED

Sideline use

Emergency / urgent care

Pediatric primary care

Return-to-play support

Military Setting

SIGNIFICANCE

The presentation at PRISM — a leading forum dedicated to the health of young athletes — reflects the growing recognition of SNAP within the pediatric sports medicine community. Dr. Master's presentation affirms that fast, accurate, baseline-free concussion diagnosis is not only possible but essential for protecting the long-term health and safety of pediatric athletes at every level of sport.
